Mississippi MDOT Permit Portal

Playwright Automation SOP — 72 Hour Legal Trip

Portal URL:	https://permits.mdot.ms.gov/
Company:	Mega Trucking LLC — USDOT 2582238
Permit Type:	72 Hour Legal Trip
Scope:	Automate the permit flow from login through the final review screen. The script MUST stop before clicking **Submit**.

HARD STOP — HUMAN-IN-THE-LOOP REQUIRED
The Playwright script must navigate through all steps up to and including the Permit Provisions screen, but it MUST NOT click the Submit button. A human reviews and submits manually. This is a non-negotiable architectural rule for every Mega Trucking permit automation.

Overview

This SOP documents the full click-path for ordering a **72 Hour Legal Trip** permit on the Mississippi MDOT Express Pass portal. Every step in this document maps to a single Playwright action (navigate, fill, click, select). Field values that come from the Supabase fleet table or dashboard input are called out explicitly.

Mississippi's portal autopopulates most vehicle fields once a unit is selected from the Vehicle Inventory dropdown, which keeps the Playwright field-mapping surface small.

Credentials

Credentials should be loaded from environment variables or the backend secrets store, never hardcoded in the Playwright script. Placeholder names below:

Username env var	MS_MDOT_USERNAME
Password env var	MS_MDOT_PASSWORD
Login URL	https://permits.mdot.ms.gov/

Dashboard Input Contract

The backend passes the following fields to the Playwright task. All other form values are either static constants or autopopulated by the MS portal after vehicle selection.

unit_number	Tractor unit number (e.g., F101). Used to match a vehicle in the MS Vehicle Inventory dropdown.

effective_date	Permit start date, MM/DD/YYYY. The **To:** date autopopulates (start + 3 days).
effective_time	Permit start time, e.g., 12:00 AM.
driver_type	F, LP, T → use Mega USDOT 2582238 and Mega insurance. Other types are not expected for this MS flow yet.

The MS portal does not prompt for USDOT, insurance, or load description in the 72 Hour Legal Trip flow — those are tied to the company account. Unlike Georgia, there is no per-permit insurance entry required here.

Step 1 — Login

Navigate to the portal URL. Fill the Username and Password fields, then click **Submit**.

Playwright actions:

• page.goto('https://permits.mdot.ms.gov/')
• page.fill('input[name="Username"]', MS_MDOT_USERNAME)
• page.fill('input[name="Password"]', MS_MDOT_PASSWORD)
• page.click('button:has-text("Submit")')

Confirm exact selectors at runtime — element names above are educated guesses. The script should locate fields by visible label where possible (e.g., getByLabel('Username')) for resilience.

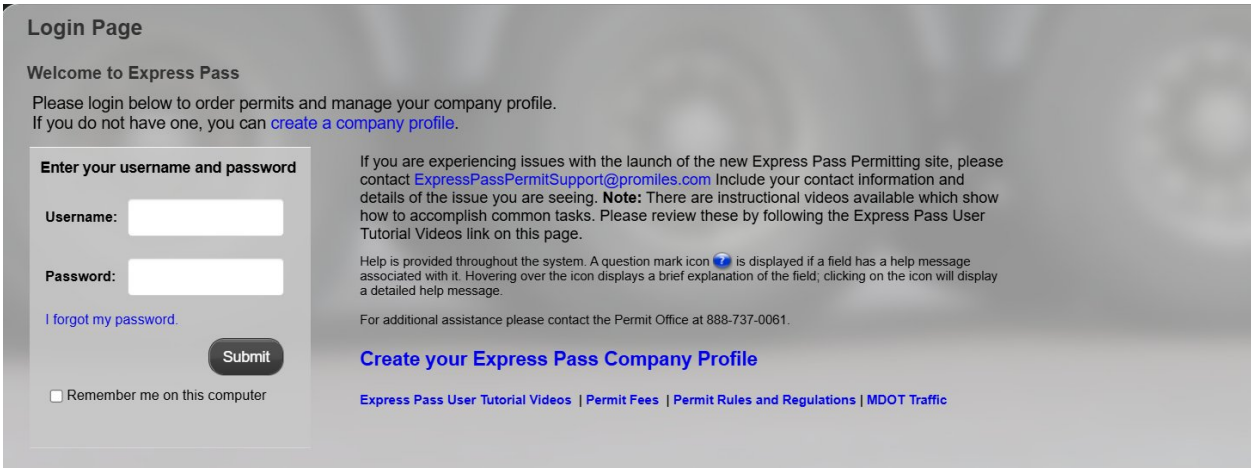

Figure 1 — Login page

Step 2 — System User Notice

After login, a **System User Notice** screen appears with two disclaimer checkboxes. Both must be checked, then click **I Understand and Agree**.

Playwright actions:

• Check both disclaimer checkboxes (one for the government system warning, one for the check-payment notice).
• page.click('button:has-text("I Understand and Agree")')

Prefer input[type="checkbox"] selectors scoped to the row containing each disclaimer text rather than positional selectors — row order could change.

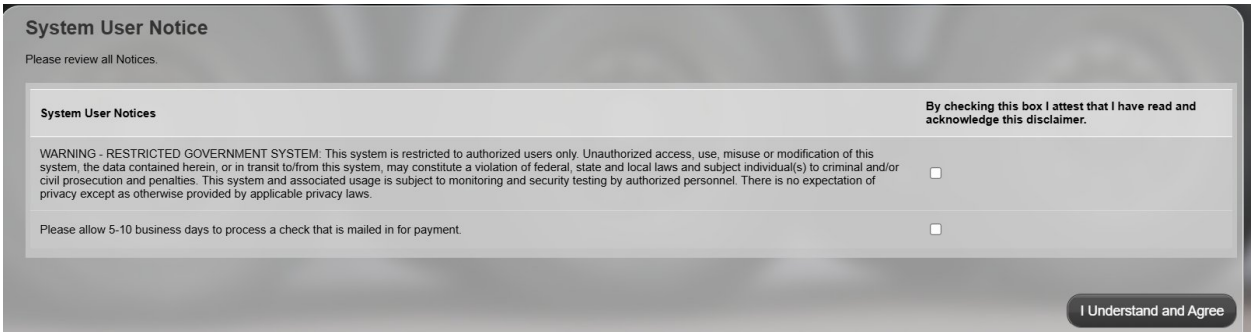

Figure 2 — System User Notice (both boxes must be checked)

Step 3 — Company Dashboard → New Permit

On the Company Dashboard, click **New Permit…**. A small dropdown menu appears — click **I know which permit I need**.

Playwright actions:

• page.click('button:has-text("New Permit")')
• page.click('text=I know which permit I need')

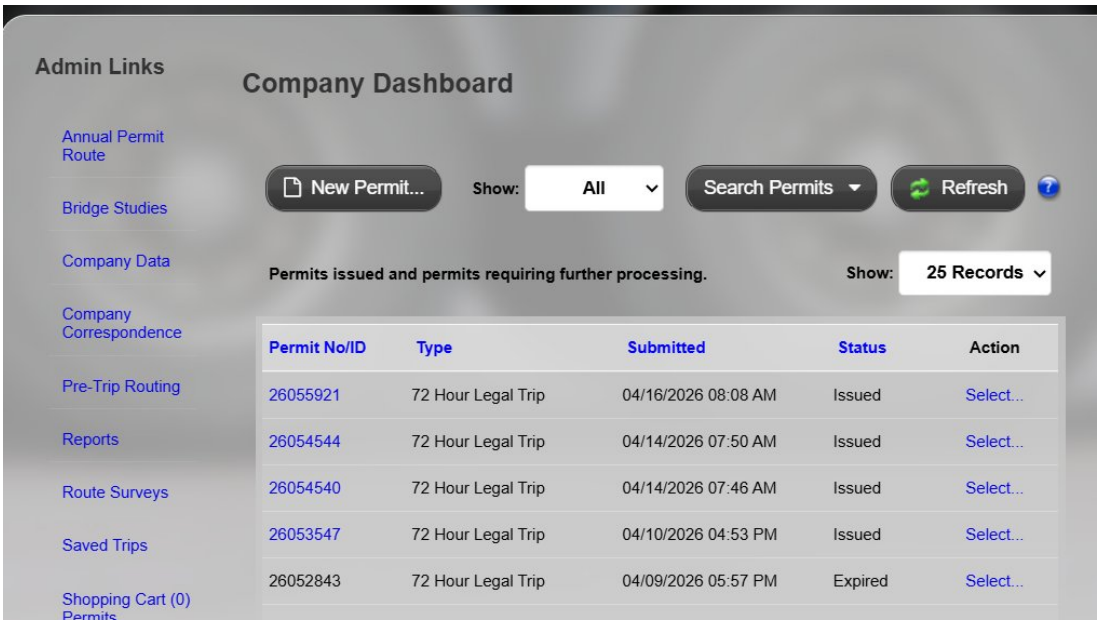

Figure 3 — Company Dashboard

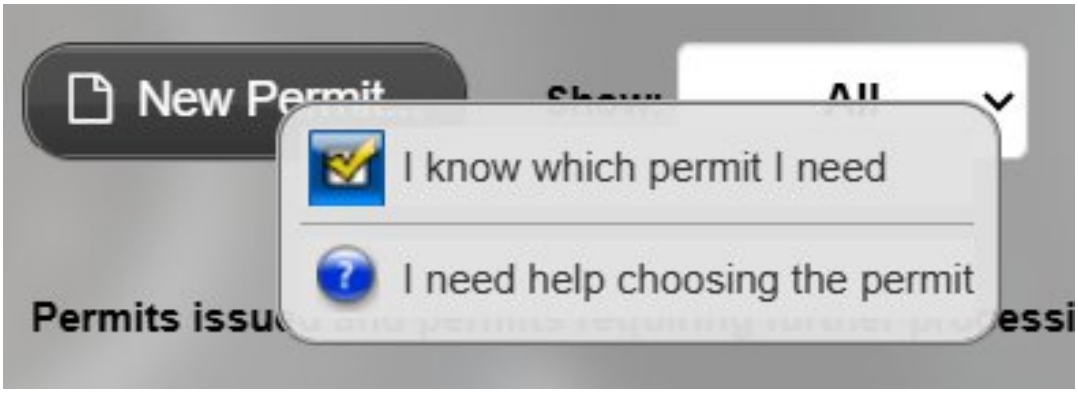

Figure 4 — New Permit dropdown menu

Step 4 — Order Permits: Contact Information

The **Order Permits** page opens. The top portion is a Contact Information block. Fill exactly as shown below. These are static values for Mega Trucking and should be hardcoded constants (or pulled from a company config) in the Playwright script.

Contact Name	Michael Caballero
Contact Phone	786-332-5691
Contact Email	INFO@MEGATRUCKINGLLC.COM
Primary Delivery Method	Email
Email Address	INFO@MEGATRUCKINGLLC.COM
Additional Delivery Method	(leave as Select…)
Company Reference	MEGA TRUCKING LLC

If any of these fields arrive pre-filled from a saved session, the script should still overwrite them (clear + fill) to guarantee correctness across sessions.

Figure 5 — Contact information block on the Order Permits page

Step 5 — Scroll to Permit Type

Still on the Order Permits page, scroll down until the **Permit Type** dropdown is visible.

Playwright actions:

• page.locator('text=Permit Type').scroll_into_view_if_needed()

Step 6 — Select “72 Hour Legal Trip”

From the Permit Type dropdown, select **72 Hour Legal Trip**. This is the only permit type this automation handles in its first iteration — other options (Blanket, Harvest, Port, Single Trip) are out of scope.

Playwright actions:

• page.select_option('select[name="PermitType"]', label='72 Hour Legal Trip')

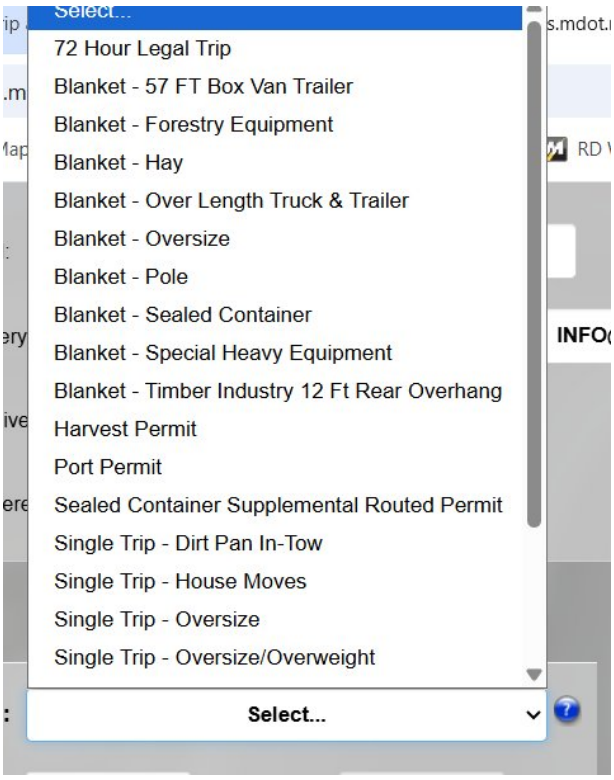

Figure 6 — Permit Type dropdown, with “72 Hour Legal Trip” at the top

Step 7 — Effective Date & Time

After selecting **72 Hour Legal Trip**, the page reveals a **From:** date picker, a time field, and a read-only **To:** field.

From date — set to the effective_date passed from the dashboard (MM/DD/YYYY).
From time — set to the effective_time passed from the dashboard (e.g., 12:00 AM).
To date — autopopulates (From + 3 days). Do not set this field.

Playwright actions:

- page.fill('input[name="EffectiveDate"]', effective_date)
- page.fill('input[name="EffectiveTime"]', effective_time)
- Verify the To: field populated correctly before continuing (read-only).
- page.click('button:has-text("Next")')

> *If the date input is a native calendar widget and direct fill() does not work, fall back to typing the date string character-by-character or pressing the calendar's navigation buttons until the correct day is highlighted, then click it.*

Verify the Permit Type is correct before clicking Next — per the on-screen red notice, the Permit Type cannot be changed after this step. The script should read back the selected Permit Type value and confirm it matches “72 Hour Legal Trip”; otherwise fail loudly.

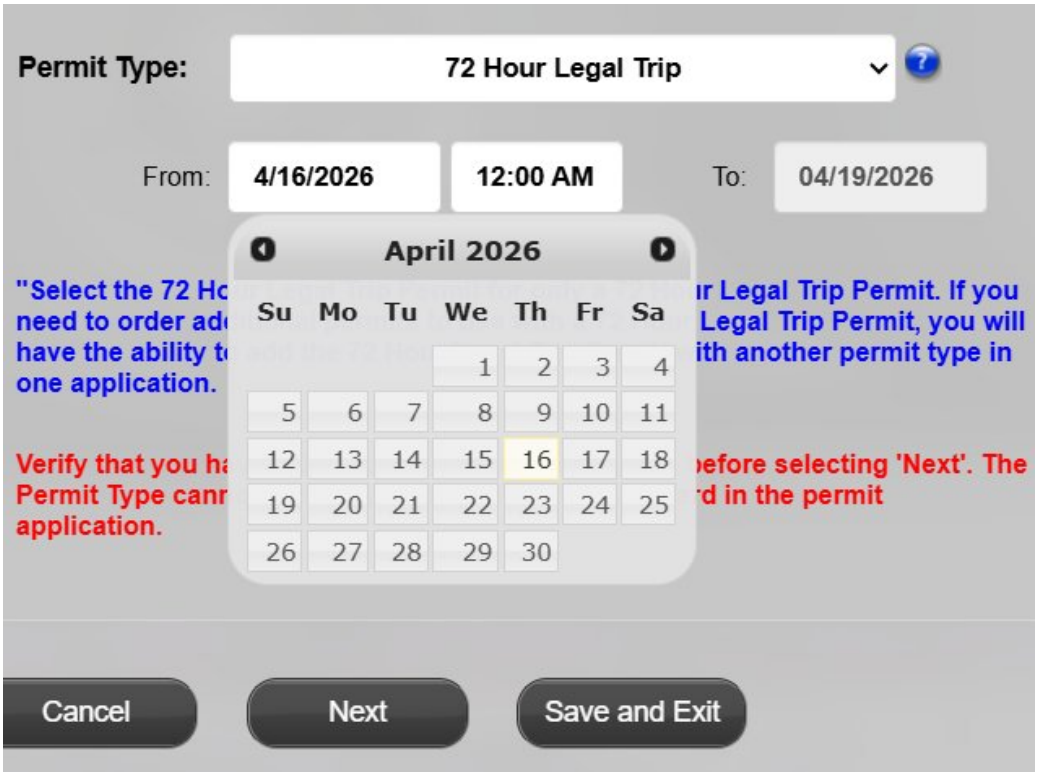

Figure 7 — Effective date calendar; To: field autopopulates

Step 8 — Vehicle Selection

The **Order Permits** vehicle page loads. The only field the script needs to set is **Vehicle Inventory** — all remaining fields autopopulate from the MS portal's saved fleet data once a unit is chosen.

The Vehicle Inventory field is a type-ahead dropdown: typing the unit number (e.g., F101) will match an entry in the saved list. The script should type the unit and then click the matching option.

Playwright actions:

• page.locator('[name="VehicleInventory"]').click()
• page.keyboard.type(unit_number)
• page.click(f'text="{unit_number}"') — exact-match on the dropdown option

After selection, verify that Unit/Rig Number, Year, Make, VIN, Vehicle Tag, and State all populated. If any are blank, fail loudly — this indicates the unit is not registered in the MS portal's saved fleet and needs to be added manually before automation can proceed.

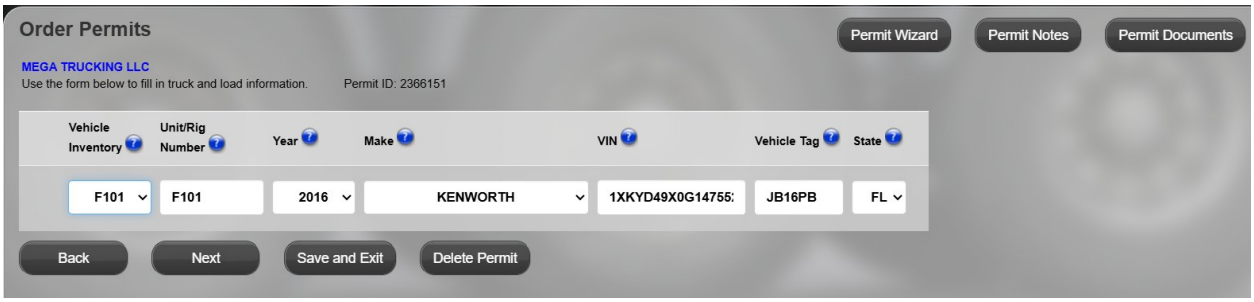

Figure 8 — Vehicle info page; all fields except Vehicle Inventory autopopulate

Step 9 — Click Next

After confirming all vehicle fields populated, click **Next**.

• page.click('button:has-text("Next")')

Step 10 — HARD STOP at Permit Provisions

The final page is **Permit Provisions**, which lists the conditions of the permit and shows **Back, Save And Exit, Delete Permit,** and **Submit** buttons.

> **DO NOT CLICK SUBMIT.**
> **The Playwright script ends here. Take a full-page screenshot for the audit trail, save the session state, and return control to the human reviewer. The dispatcher confirms the provisions and clicks Submit manually.**

Playwright actions at this step:

• Wait for the Permit Provisions table and Submit button to be visible.
• page.screenshot(path=f'ms_{permit_id}_review.png', full_page=True)
• Save storage state / context for the reviewer session (if applicable).
• Return success to the Celery task; do **not** click Submit.

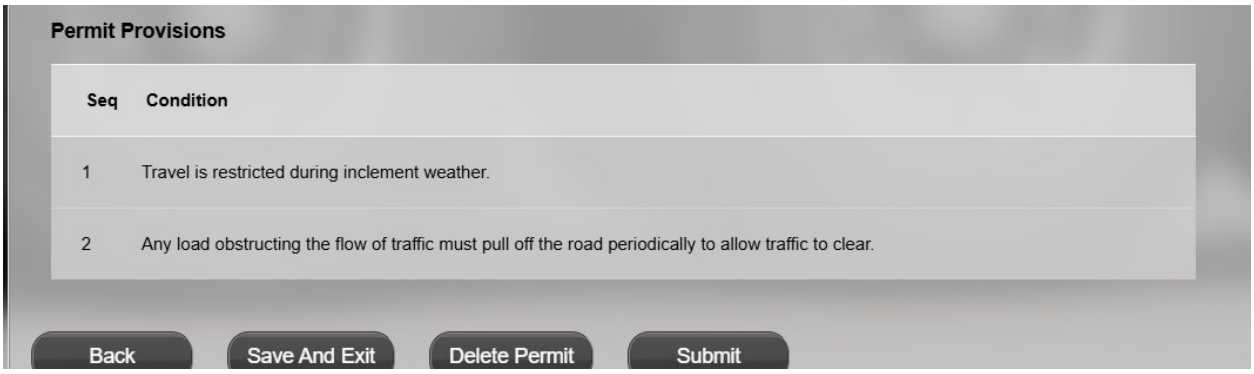

Figure 9 — Permit Provisions page. Script stops here; human clicks Submit.

Safety Rules & Guardrails

The Playwright script for this portal MUST enforce:

1. **Never click the Submit button** on the Permit Provisions page, under any circumstance, in any branch, including error-recovery paths.
2. **Never enter payment information**. The MS 72 Hour Legal Trip flow does not currently prompt for payment in the documented path, but if a payment screen ever appears, the script must abort immediately.
3. **Fail loudly on missing vehicle data.** If vehicle auto-populate fails, do not fabricate values; surface the error to the backend so a human can register the unit in the MS portal.
4. **Fail loudly on Permit Type mismatch.** Read back the selected Permit Type before clicking Next on Step 7, since this choice is locked thereafter.
5. **Respect rate limits.** The MS portal has not shown a 45-minute delay like Georgia, but the script should still use polite waits and not hammer the site.

CLAUDE.md additions

When handing this to Claude Code, the per-portal CLAUDE.md should include the hard stop, the fact that MS does not ask for USDOT/insurance on this flow, and the autopopulate-or-fail rule for vehicle data.

Suggested test plan

1. **Unit test** — field-mapping functions with a mocked page.
2. **Mock HTML portal** — serve local fixtures of each of the 9 screens above and run the full flow.
3. **Dry run on real portal** — run through Step 10, capture the review screenshot, and exit without submitting. Verify the screenshot shows correct driver, dates, and vehicle.
4. **Single real submission** — one human-supervised end-to-end run where the dispatcher clicks Submit on the Permit Provisions page to confirm the captured state was valid.

End of SOP. Hand this document to Claude Code along with the project CLAUDE.md and the Supabase fleet schema. Request: build a Playwright script that executes Steps 1–10 above, stopping before Submit.
